# Nashoba Regional Schools Rowlandson & Burbank Schools

Bolton, MA

2020

# **HVAC System Evaluation**

## **Prepared For:**

Nashoba Regional School District 50 Mechanic Street Bolton, MA 01749

## **Prepared By:**

BLW Engineers, Inc. 311 Great Road Post Office Box 1551 Littleton, MA 01460

September 4, 2020

#### **EXECUTIVE SUMMARY**

#### General

The Nashoba Regional School District engaged BLW Engineers to evaluate the HVAC systems serving these buildings relative to their current operating conditions, re-opening of the building to the public and potential considerations related to Covid-19.

While at the site, BLW Engineers met with the facilities operator who reported the HVAC systems receives regular preventative maintenance which includes filter replacement, grease motors and bearings, replace fan belts and verify damper and valve operation.

The Rowlandson Elementary School and Burbank Middle School are located at 103 Hollywood Drive in Lancaster. The schools comprise approximately 97,000 square feet and 46,600 square feet of educational space with enrollments of approximately 470 students and 250 students respectively. The buildings were originally constructed in 2002, with most of the HVAC systems and equipment having been installed at that time.

#### Rowlandson Elementary School and Burbank Middle School Planned Reopening

The Nashoba Regional School District plans on the following school re-opening for the Rowlandson Elementary School and Burbank Middle School:

- School is to be occupied by students and teachers in the hybrid model with 50% occupation Monday/Tuesday; Wednesday disinfection/cleaning; 50% occupation Thursday/Friday; Saturday disinfection/cleaning.
- Classrooms seating will be reorganized to provide recommended social distancing.
- Cafeteria will not be used in normal fashion; students will eat lunches at their desk.
- Gym will not be used in normal fashion.
- Library and Auditorium will not be used in normal fashion; they will be used primarily as classroom space.

#### **Recommendations**

Based on applicable guidelines (ASHRAE, State of Massachusetts Re-opening Guidelines, Massachusetts Teachers Association, etc.), the Rowlandson Elementary School and Burbank Middle School School is safe to occupy and should consider the following best practice operation of the current HVAC system in an effort to provide an environment to best protect the occupants and visitors to the building during the pandemic:

Tier 1 Recommendations: Tier 1 recommendations are immediate revisions to system operation prior to start of classroom and until the start of the heating season.

- 1. Create an "Epidemic Mode" Building Management System sequence of operation that can be turned on, shut down or override, if needed, by manual selection of the operator.
- 2. Replace the unit filters with the best filters available that will not impact the heating capacity of the units and develop a filter replacement plan; the existing rooftop units and air handling units

- will not be able to accommodate MERV13 filters without significantly impacting system operation, outdoor air delivery to the space and equipment component failures.
- 3. Filter upgrades will require more frequent changes due to pressure drop of filter and particulates that "dirty" the filters.
- 4. Continued operation of heating and cooling systems is recommended.
- 5. Operate toilet exhaust fans 24 hours a day, 7 days a week.; other fans shall operate two hours prior and two hours post occupied hours.
- 6. Monitor Carbon Dioxide (CO2) levels in occupied areas of the building.
- 7. Should building exhaust exit building through sidewall louvers subject to pedestrian traffic, provide warning signs and consider diverting or rearranging the exhaust air discharge locations so that they would pose no opportunity to cause harm.
- 8. Operate the building in occupied mode with mechanical ventilation prior and two hours post occupied hours; where mechanical ventilation and exhaust are not currently provided, utilize operable windows.
- 9. Operate the building in the occupied mode during disinfection and cleaning operations.
- 10. Operate building air handling equipment with highest percentage of outdoor air possible without adversely affecting the occupied environment; outdoor air percentage will be dependent on outdoor air temperature and allowable indoor air temperatures above/below normal operation.
- 11. Operate Classroom unit ventilators with ventilation as originally designed. Based on reduced classroom sizes, the classroom current system can provide more than 25 CFM/occupant which exceeds current code requirements (10 CFM per occupant plus 0.12 CFM/SF) and can be supplemented by operable windows.
- 12. Operate Classroom heating/ventilating unit (HV-1) with ventilation as originally designed. Based on reduced classroom sizes, the classroom current system can provide more than 30 CFM/occupant which exceeds current code requirements (10 CFM per occupant plus 0.12 CFM/SF) and can be supplemented by operable windows.
- 13. Operate all air handling equipment at maximum design air flow; there was no available data on the outdoor for ventilation design and should have balancing measurements taken to determine space occupancy based on the unit's capability of providing 20/CFM per occupant. The units were installed in 2002 and presumably met code requirements; therefore, the units should be able provide 20 CFM/occupant for half of the normal occupied load of each space.
- 14. At the commencement of school and until the heating season and when outdoor air temperature conditions allow, the air handling equipment can be operated with recirculated air can be run in the "economizer mode" with 100% outdoor air and no recirculation.
- 15. Reset discharge air setpoint as high as possible for variable air volume systems to encourage variable air volume dampers to maximized outdoor air into the building.
- 16. Disable any CO2 demand control ventilation sequences of operation and occupancy setback controls; operate units at maximum outdoor air capacity.
- 17. Eliminate outdoor air to zones that are not occupied to better use in occupied areas.
- 18. Relocate occupants from areas that do not have mechanical ventilation or operable windows.
- 19. Use operable windows when outdoor air conditions allow.
- 20. Keep conference room doors open as much as possible or open windows when feasible.
- 21. Increase regular maintenance of all mechanical heating, ventilating and air conditioning equipment.
- 22. Monitor the heating, ventilating and air conditioning operation of the building on a continual basis.

23. Follow recommendations of holistic view of building recommendations in General Recommendations.

Tier 2 Recommendations: Tier 2 recommendations are supplemental revisions/additions to the existing systems that may be required for the heating season when systems will need to utilize recirculated air to maintain space temperature setpoints.

- 1. Provide additional filtration with portable HEPA filter units or UV filtration units for areas that might have multiple occupants served by units that utilize recirculated air.
- 2. Install portable humidifiers or retrofit existing heating/ventilating equipment with humidifiers for local humidity control.
- 3. Add plug-in type supplemental electric heat as required for increased ventilation requirements.
- 4. Apply and use outdoor air quality sensors or reliable web-based data for outdoor pollution information as part of the new ventilation operation.
- 5. Consider UV decontamination lights on highly touched surfaces.

#### Notes:

- 1. While there is ventilation air and return air associated with each classroom unit ventilator, the units only recirculate air within each classroom and do not recirculate air between classrooms. The ventilation and exhaust systems for the typical classroom is continuous and separate.
- 2. These recommendations are based on guidance provided by applicable agencies and publications for best practices for protection of occupants and visitors to the building but do not provide absolute protection from the pandemic.
- **3.** These recommendations will have a significant impact on the operating and maintenance related costs of the HVAC systems.

#### **HVAC SYSTEM EVALUATION**

#### **Existing Conditions**

The majority of the heating and cooling for both buildings is provided through a hydronic system consisting of a two-pipe, seasonal change-over distribution that is fed from the central plant in the Rowlandson School building. The central plant consists of two cast-iron, oil-fired, non-condensing boilers and variable speed circulation pumps feeding the hot water to the system as well as a centrifugal chiller, cooling tower and variable speed circulation pumps feeding the chilled water. The distribution piping supplies unit ventilators (UV), indoor air handling units (AHU), variable air volume terminal units (VAV), fan coil units (FCU) and various smaller convective heaters throughout the building. The typical air handling unit consists of a variable speed supply fan, a dual temperature hydronic coil, a variable speed return/exhaust fan, damper section and filter-mixing box.

The typical classrooms in these buildings are served by floor mounted unit ventilators and general exhaust fans which provide constant ventilation and air exchange throughout the spaces during occupied hours. The UV's draw ventilation air through a directly connected wall louver, the air is mixed with return air from the space, is filtered then heated or cooled to maintain space temperature. The UV's are controlled through the building energy management system and are capable of operating with

100% ventilation air under appropriate weather conditions. Exhaust air is drawn from each space at ceiling registers, through ductwork to exhaust fans mounted in the attic and discharges through the roof, the fans operate on a scheduled basis. The typical classroom is served by a single UV (UV-1) providing all ventilation and supply airflow and are continuously exhausted at a rate of 800 CFM. The design exhaust airflow appears to meet current code requirements, which would be 370 CFM for such a classroom size (Ventilation = 10 CFM x 25 Occupants + 0.12 CFM x 950 SF).

The corridors in these buildings are served by fan coil units mounted above the ceilings, providing ventilation and conditioned supply air to the spaces during occupied hours. The FCU's draw ventilation air through a common roof ventilator and plenum, the air is mixed with return air from the space, is filtered then heated or cooled to maintain space temperature. The units are controlled through the building energy management system. The required ventilation air flow varies by floor and area served (Ventilation = 0.06 CFM x SF).

The Teacher's Lounge, work room and Art classrooms in the Rowlandson building are served by unit ventilators and general exhaust fans which provide constant ventilation and air exchange throughout the spaces during occupied hours. The UV's draw ventilation air through a directly connected wall louver, the air is mixed with return air from the space, is filtered then heated or cooled to maintain space temperature. The UV's are controlled through the building energy management system and are capable of operating with 100% ventilation air under appropriate weather conditions. Exhaust air is drawn from each space at ceiling registers, through ductwork to roof mounted exhaust fans and discharge outdoors, the fans operate on a scheduled basis. The total airflow to these spaces is approximately 1,250 CFM and the total floor areas are 600 SF and 900 SF respectively. The required ventilation air flow to the Teacher's Lounge and work room would be 100 CFM (Ventilation = 5 CFM x # Occupants + 0.06 CFM x SF) and 350 CFM (Ventilation = 10 CFM x # Occupants + 0.18 CFM x SF). New filters have recently been installed on these units and are reported to be MERV 10 (~50% efficiency).

The Gymnasium in the Rowlandson School is served by indoor air handling units located in the Mechanical Room over the 2<sup>nd</sup> floor. The air handling units provide ventilation and conditioned supply air through a system of supply and return distribution ductwork to the Gymnasium. The units supply and return/exhaust air fans operate at variable speeds based on occupancy and to maintain space pressurization. The hot water and chilled water flow through the coil are controlled to maintain space temperature set point based on local thermostat/sensors. The units draw outdoor air for ventilation from a common louver and plenum in the Mechanical room, through ductwork where it is mixed with return air from the space, is filtered and then conditioned for supply to the space. Excess return air or exhaust air is discharged through ductwork from each unit to a common louver in the exterior wall of the Mechanical Room. The design documents indicate the total supply airflow to the Gymnasium is 12,000 CFM. The total floor area of the space is approximately 3,900 SF. The required ventilation air flow to a Gymnasium will vary based on the proportioning of play area and spectator area but this size would be consistent with a ventilation airflow of 2,000 CFM. New filters have recently been installed on these units and are reported to be MERV 10 (~50% efficiency).

The Auditorium in the Rowlandson School is served by indoor air handling units located in the Mechanical Room over the 2<sup>nd</sup> floor. The air handling units provide ventilation and conditioned supply air through a system of supply and return distribution ductwork to the Auditorium. The units supply and return/exhaust air fans operate at variable speeds based on occupancy and to maintain space pressurization. The hot water and chilled water flow through the coil are controlled to maintain space

temperature set point based on local thermostat/sensors. The units draw outdoor air for ventilation from a common louver and plenum in the Mechanical room, through ductwork where it is mixed with return air from the space, is filtered and then conditioned for supply to the space. Excess return air or exhaust air is discharged through ductwork from each unit to a common louver in the exterior wall of the Mechanical Room. The design documents indicate the total supply airflow to the Auditorium is approximately 6,000 CFM. The total floor area of the space is approximately 4,500 SF. The required ventilation air flow to an auditorium of this size would be 3,650 CFM (Ventilation = 5 CFM x # Occupants + 0.06 CFM x SF). New filters have recently been installed on these units and are reported to be MERV 10 (~50% efficiency).

The Administrative offices and spaces on the first floor in the Rowlandson School are served by an indoor air handling unit located in the Mechanical Room over the 2<sup>nd</sup> floor, with variable air volume terminal units and fin tube radiation for the individual spaces. The AHU provides ventilation and conditioned supply air through a system of supply and return distribution ductwork to variable air volume terminal units. The unit supply air set point is established by the control programming to satisfy cooling demand in the worst-case zone on the system, with final tempering of the air being controlled by the individual VAV units. The VAV units modulate supply air flow and hot water flow through integral reheat coils to maintain zone temperatures based on local thermostat/sensors. The design documents indicate the total supply airflow to these spaces is approximately 3,050 CFM. The total floor area of the spaces is approximately 2,500 SF. The required ventilation air flow to this area would be approximately 400 CFM (Ventilation = 5.0 CFM x # Occupants + 0.06 CFM x SF). New filters have recently been installed on these units and are reported to be MERV 10 (~50% efficiency).

The Music Room in the Rowlandson School are served by unit ventilators mounted above the ceiling, providing ventilation and conditioned supply air through a system of supply and return distribution ductwork to that space. The units draw ventilation air from a wall louver through ductwork to the unit where it mixes with return air from the space, is filtered and then conditioned for supply to the building. The supply fans operate at constant speed, the hot water and chilled water flow through the coil are controlled to maintain space temperature set point based on local thermostat/sensors. The design documents indicate the total supply air flow to these spaces of approximately 1,260 CFM. The floor area of each space is approximately 900 SF. The required ventilation air flow to this area would be approximately 500 CFM (Ventilation = 10 CFM x # Occupants + 0.06 CFM x SF). New filters have recently been installed on these units and are reported to be MERV 10 (~50% efficiency).

The Band and Music rooms in the Rowlandson School are served by an indoor air handling unit located in the Mechanical Room over the 2<sup>nd</sup> floor, with variable air volume terminal units serving the individual spaces. The unit provides ventilation and conditioned supply air through a system of supply and return distribution ductwork to each space. The units draw ventilation air from a wall louver through ductwork to the unit where it mixes with return air from the space, is filtered and then conditioned for supply to the building. The unit supply air set point is established by the control programming to satisfy cooling demand in the worst-case zone on the system, with final tempering of the air being controlled by the individual VAV units. The VAV units modulate supply air flow and hot water flow through integral reheat coils to maintain zone temperatures based on local thermostat/sensors. The design documents indicate the total supply airflow to these spaces is approximately 1,560 CFM and 1,140 CFM respectively. The floor area of each space is approximately 1000 SF and 750 SF. The required ventilation air flow to these areas would be approximately 410 CFM and 305 CFM (Ventilation = 10 CFM x # Occupants + 0.06 CFM x

SF). New filters have recently been installed on these units and are reported to be MERV 10 (~50% efficiency).

The Media Center on the first floor and the Computer Lab on the second floor in the Rowlandson building are served by unit ventilators and general exhaust fans which provide constant ventilation and air exchange throughout the spaces during occupied hours. The UV's draw ventilation air through a directly connected wall louver, the air is mixed with return air from the space, is filtered then heated or cooled to maintain space temperature. The UV's are controlled through the building energy management system and are capable of operating with 100% ventilation air under appropriate weather conditions. Exhaust air is drawn from each space at ceiling registers, through ductwork to exhaust fans in the attic and discharge outdoors, the fans operate on a scheduled basis. The total floor areas are 2,600 SF and 1,050 SF respectively. The required ventilation air flow to the Media Center and Computer Lab would be 1,000 CFM and 390 CFM respectively (Ventilation = [10 CFM x 0.025 Occupants/SF + 0.12 CFM] x SF).

The Media Center and Library in the Burbank building are served by packaged DX rooftop units which provide ventilation and supply air to the spaces. Outdoor air is drawn into the unit cabinet, mixes with return air from the space, is filtered then heated or cooled to maintain space temperature. The units are controlled through the building energy management system and are capable of operating with 100% ventilation air under appropriate weather conditions. The required ventilation air flow would be (Ventilation =  $[10 \text{ CFM} \times 0.025 \text{ Occupants/SF} + 0.12 \text{ CFM}] \times \text{SF}$ ).

Bathrooms, Janitor's Closets, Storage, etc. are exhausted through registers and ductwork connected to roof mounted exhaust fans. Bathrooms are provided with hot water heating terminal equipment.

Specialty exhaust systems have been provided for the Science Rooms, Art Room and Storage.

The electric room has been provided with heat dissipation systems including an exhaust fan, a gravity intake with motor operated damper and a temperature sensor to maintain a maximum space temperature.

Miscellaneous spaces have been provided with hot water terminal equipment interconnected with the hot water distribution piping system.

The building is monitored and operated electronically by a system of direct digital controls (DDC).

#### **General Recommendations**

Operating school buildings under epidemic conditions requires a holistic framework during the crisis and the restoration to potentially a new "normal" after the public health emergency has ended. Considerations include:

- Review of current operational practices
- Holistic view for owner/operator

**Review of current operational practices** 

- Modes of operation of HVAC systems
  - o sequences of operations
  - o set points
  - o schedules
- Verification that equipment and systems are properly functioning and have the enhanced capabilities to address public health considerations, with a focus building air circulating systems.
- Understanding that infected people who are asymptomatic may enter buildings, increasing the likelihood of the spread of virus through air systems to other occupants.

#### Holistic view for owner/operator

#### Owners and operators should take a holistic view of their buildings and:

- 1. Develop a pandemic preparedness plan
- 2. Review indoor and outdoor environment
- 3. Review the space types
- 4. Operate and maintain HVAC
  - o Air-Conditioning and Ventilation systems
  - Exhaust systems
- 5. Check Elevator Control
- 6. Check BAS and Access Control Systems

#### **Develop a Pandemic Preparedness Plan**

#### **Consider these possible goals:**

- Reduce the spread of infection among building occupants,
- Maintain HVAC and Building Service Systems in safe and healthy conditions,
- Minimize impact on building occupants and visitors,
- Communicate risks and precautions being taken with occupants transparently
- Implement measures that help make occupants feel secure:
  - Require occupants, visitors and maintenance personnel to wear appropriate PPE per CDC,
  - Screen, monitor and control the circulation of occupants and guests to help avoid transmission of disease,
  - o Increase frequency for surface disinfection on frequently touched surfaces, such as door handles, handrails, door bells and elevator buttons.

#### Ensure continuity of supply chains and have backup plans.

- Identify your critical suppliers, e.g. filters, cleaners, disinfectants, parts, PPE, etc.,
- Identify vendors who could negatively affect your operation if they fail to deliver,
- Review current service provider agreements to see if alternate suppliers can be engaged in the
  event of a supply disruption, for example, equipment service providers, and understand
  contract limitations and restrictions on using alternative providers,
- Ask critical suppliers to share their pandemic plans:
  - o What does their plan include?

- Have they tested their plan? When was it updated?
- Set boundaries with suppliers ask that they do not send staff who may be showing signs of illness to your property.

#### **Review contract agreements:**

Review contract agreements: Review contracts with service providers, utilities, and suppliers to
determine what rights and remedies they have because of disruptions due to unforeseeable
circumstances that prevent fulfillment of a contract.

#### Establish a communication protocol and continuity of operations plan:

- Identify key contacts and publish normal and emergency contact information,
- Document the chain of command and communication requirements, and provide instructions and outline expectations for how all responses are to be documented and what records shall be maintained and distributed.

#### Provide staff with:

- Back-up supply of PPE per CDC and OSHA requirements,
- Training custodial staff on the proper use and disposal of PPE and waste,
- Cross training to ensure critical building functions are maintained in an emergency, and
- Instruction to staff to stay at home if they are feeling sick.

Check with insurance providers to determine whether there are special measures that can be taken to preserve coverage or lower premiums.

#### **Next Steps:**

- 1. Notify staff, tenants and visitors about the plan
- 2. Follow all local, state and federal executive orders, statutes, regulations, guidelines, restrictions and limitations on use, occupancy and separation
- 3. Follow OSHA Guidelines, especially the portion in the guide regarding filter and outside air.
- 4. Ensure that custodial staff and service providers job descriptions includes performing proper cleaning procedures based EPA and CDC guidance using approved products and methods:
  - Disinfect high touch areas of HVAC and other Building Service systems such as on/off switches, and thermostats;
  - o Consider UV light disinfection devices of high touch counters in public spaces.
  - Disinfect interiors of refrigerated devices, such as refrigerators, coolers and vending machines where the virus can survive for potentially long periods of time.
- 5. Consider installing a thermal camera at building entrances to help screen visitors for elevated body temperatures. Note that that infected individuals may show no signs of being ill, including having no fever, and can be responsible for much of the transmission. In such cases, thermal imaging may not be effective.
- 6. The air handling unit systems were designed for MERV13 filters but have been utilizing MERV8; provide all units with new MERV13 filters.

- 7. The air handling systems could be retrofitted for UV decontamination systems in the return airstream; or consider installing portable filtration and air cleaning devices such as UVGI (Ultraviolet Germicidal Irradiation), especially if seniors or anyone with other health issues or compromised immune systems may be located, or, in mission critical areas where required.
- 8. Units with special event switches should be operated in special event mode and/or disable CO2 demand control ventilation system; operate units at maximum outdoor air.
- 9. Provide automatic hand sanitizer dispensers in the high touch areas and other common areas, including spaces where equipment where frequent maintenance is required, and ensure dispensers are serviced often and remain operational.
- 10. Post signage in prominent locations that contain information and instructions to educate and remind staff about proper procedures to maintain personal protection while cleaning, replacing filters and moving or using other equipment that maybe contaminated
- 11. Consider providing antimicrobial door mats at high traffic entrances to the building.
- 12. Institute additional cleaning procedures to ensure proper disinfection of bathrooms, kitchens and common areas. Educate cleaning and maintenance staff on proper personal protection and PPE use including following OSHA worker exposure guidelines.

#### **Review Indoor and Outdoor Environment**

- Maintain dry bulb temperatures within the comfort ranges indicated in ANSI/ASHRAE Standard 55-2017
- Maintain relative humidity between 40% and 60% through the use of the air conditioning systems.

#### **In Cold Climates**

- i. HVAC systems with no humidification may not achieve the minimum humidity indicated,
- ii. Observe building assemblies and finishes frequently for condensation when indoor dew points rise above the surface temperatures of the assemblies and finishes,
- iii. Excessive humidity may lead to condensation, indoor mold growth, and degradation of indoor air quality.

#### Review the space types

Conference Rooms	Keep doors to be opened to promote good ventilation where possible. If doors must be closed, consider local air filtration and cleaning devices and appliances such as portable air filters, or provide local exhaust fans discharging directly to the outside to improve ventilation.
Pantries/Storage Rooms	Provide local exhaust, or portable air filtration and cleaning appliances, especially if refrigerators, or similar appliances, are presented.
Public/Large Assembly Spaces	Where there can be a large assembly of people, consider air treatment, e.g. upper-room UVGI lamps.

#### Operate and maintain the HVAC system

Building owners and service professionals should follow the requirements of ASHRAE Standard 180-2018, Standard Practice for the Inspection and Maintenance of Commercial HVAC Systems which has tables to show the typical maintenance required for equipment that has been in operation. Consider PPE when maintaining ventilation materials including filters, condensate. Consult additional guidance before duct cleaning. Check specifically:

- Dampers, filter, and economizers seals and frames are intact and clean, are functional and are
  responding to control signals. MERV13 or higher filters are required for capture of airborne
  viruses; most existing rooftop equipment has the capacity to support the associated pressure
  drop of these filters and equipment should be provided with only the highest MERV rating that
  does not affect the heating and cooling capacity of the units.
- Zone and air temperature are calibrated and accurately reporting environmental conditions to the BAS or local controllers.
- Exhaust fans are functional and venting to the outdoors.
- Check outside air intake regularly for any potential risk such as exhaust nearby and provide proper clearance if assessible by pedestrians, etc.

#### Operate and maintain the HVAC system – Air conditioning and ventilation systems

- Continued operation of all systems is recommended.
- For offices with fan coil units, open windows 2 hours before and after occupied periods.

#### Centralized and floor-by-floor Variable Air Volume (VAV) systems: General information

• For central or floor-by-floor VAV systems that have the capacity to operate with 100% outside air, such as an economizer cycle, close return air dampers and open outdoor air dampers to 100% or to the maximum setting that the HVAC system can accommodate and still maintain acceptable indoor conditions.

- If there are heating and cooling coils to temper the air, it can provide comfort and eliminate recirculation (in the mild weather seasons this will have smaller impacts to energy consumption, thermal comfort, or humidity control, however, using 100% outside can be more difficult in extreme weather conditions).
- Considerations also should be given in areas with dry outside air that may lower the relative humidity to below 40%.
- Prioritize increasing outside air over humidity (see concerns about operating at indoor humidity outside the range of 40%-60%).

#### Centralized and floor-by-floor Variable Air Volume (VAV) systems: Floor-by-floor

- In floor-by-floor VAV systems that have only minimum outside air damper positions or openings, open outside air damper to its maximum position (the same cautions and concerns stated above apply).
- If outside air is supplied centrally from outside air handling units (typically at mechanical levels) to all floors, and there are unoccupied tenant floors, divert the outside air to the occupied floors.
- Consider changing the floor level VAV air handling units' discharge air temperature setpoint the maximum (typically no higher than 60° F).
- This will cause VAV terminal units (boxes) to open to try and satisfy space cooling loads which will increase the number of air changes in the space being served.

#### Centralized and floor-by-floor Variable Air Volume (VAV) systems: Cooling coils

- Cooling coils, heating coils and condensate drain pans inside air handling equipment can become contaminated.
- Therefore, consider adding UVGI for coil surface and drain pan disinfection are encouraged as it will reduce the needs and frequency for in-person coil surface disinfection.
- These devices and systems should be monitored often and regular and emergency maintenances should continue.
- Provide PPE protection for building operators, maintenance technicians and anyone else who must inspect or come in contact with the device or equipment.

#### Centralized and floor-by-floor Variable Air Volume (VAV) systems: Operable windows

- In buildings with operable windows, when outside air thermal and humidity conditions and outdoor air quality are acceptable, open windows where appropriate during occupied hours.
- Disabling the interlock between opening windows and air conditioning system lockout or shut down if this feature is provided for in the Building Automation System.
- Monitor indoor spaces for possible contaminants entering through the windows such as toilets
  exhaust located nearby or for windows accessible to public and high traffic on adjacent streets
  and walkways.
- Exposure to seasonal and other outdoor allergens (pollen and mold spores) may occur with windows opened.
- Special ductwork cleaning, or, changing filters more often than normal is not necessary.

#### **Domestic Heating Water systems:**

• Keep heating water systems circulating and maintain temperatures above 140°F to avoid microbial incursion. Do not let water temperature to drop below 120°F.

#### Operate and maintain the HVAC system - Exhaust systems

- Exhaust system for toilets should run 24/7. Do not open operable windows in toilets.
- Other exhaust systems should continue to run as normal. Run exhaust systems 2 hours before and after occupied periods.
- If there are exhaust outlets located in pedestrian areas outside, provide warning signs and consider diverting or rearranging the exhaust air discharge locations so that they would pose no opportunity to cause harm.

#### **Elevator Control**

- 1. Turn on elevator cab (lift) ventilation fans, where possible
- 2. Encourage occupants to take stairs, where possible, especially when elevator lobbies are crowded.
- 3. Allow elevators to run at high speed to minimize time in elevator.
- 4. Close elevator lobby vestibule doors, if available.
- 5. Consider local air treatment devices in frequently used lifts.

#### **Building Automation System and Access Control System Programming**

#### **Building Automation Systems:**

- Automate the control sequences in this document as a "Safety Mode" operation that can be turned on, shut down or override, if needed, by manual selection of the operator.
- Provide remote access to staff and trusted service providers who are responsible for operating
  and maintain Building Automation Systems, security, access control, information technology,
  fire alarm and life safety systems. Have written procedures and test remote access and secure
  access levels and permissions for all individuals prior to an emergency, if possible.

#### Access Control Systems:

- Post signage and communicate to tenants, and post visitors' procedures for entering and leaving the building that will minimize the time spent in public spaces.
- Use touchless assess control system if available and where possible.
- Require and enforce social distancing within public and shared spaces using signage.
- Ensure that workspaces are situated to accommodate social distancing recommendations

#### **Conclusions**

Based on applicable guidelines, the Hudson High School should consider the following best practice operation of the current HVAC system in an effort to provide an environment to best protect the occupants and visitors to the building during the pandemic:

#### Tier 1 Recommendations:

- 24. Create a "Safety Mode" Building Management System sequence of operation that can be turned on, shut down or override, if needed, by manual selection of the operator
- 25. Replace the rooftop equipment filters with MERV13 filters or higher.
- 26. Continued operation of heating and cooling systems is recommended.
- 27. Operate toilet exhaust fans 24 hours a day, 7 days a week.; other fans shall operate two hours prior and two hours post occupied hours.
- 28. Provide warning signs and consider diverting or rearranging the exhaust air discharge locations so that they would pose no opportunity to cause harm.
- 29. Operate the building in occupied mode with mechanical ventilation prior and two hours post occupied hours; where mechanical ventilation and exhaust are not currently provided, utilize operable windows.
- 30. Operate air handling equipment with highest percentage of outdoor air possible without adversely affecting the occupied environment; outdoor air percentage will be dependent on outdoor air temperature and allowable indoor air temperatures above/below normal operation.
- 31. Reset discharge air setpoint as high as possible to encourage variable air volume dampers to maximized outdoor air into the building.
- 32. Operate units that have special event switches in special event mode and/or disable any CO2 demand control ventilation sequences of operation; operate units at maximum outdoor air capacity.
- 33. Eliminate outdoor air to zones that are not occupied to better use in occupied areas.
- 34. Use operable windows when outdoor air conditions allow.
- 35. Keep conference room doors open as much as possible or open windows when feasible.
- 36. Increase regular maintenance of all mechanical heating, ventilating and air conditioning equipment.
- 37. Monitor the heating, ventilating and air conditioning operation of the building on a continual basis.
- 38. Follow recommendations of holistic view of building recommendations in General Recommendations.

#### Tier 2 Recommendations:

- 6. Provide additional filtration with portable HEPA filter units or UV filtration units when applicable.
- 7. Install portable humidifiers or retrofit existing heating/ventilating equipment with humidifiers for local humidity control.
- 8. Add plug-in type supplemental electric heat as required for increased ventilation requirements.
- 9. Apply and use outdoor air quality sensors or reliable web-based data for outdoor pollution information as part of the new ventilation operation.
- 10. Consider installing Needlepoint Bipolarization Ionization in return airstream for air handling equipment with large percentages of outdoor air.

#### Notes:

- 4. While there is ventilation air and return air associated with each rooftop equipment, the units were designed for pre- and bag filters and can support the pressure drop of MERV13 or greater filters in accordance with applicable guidelines.
- 5. These recommendations are based on guidance provided by applicable agencies and publications for best practices for protection of occupants and visitors to the building but do not provide absolute protection from the pandemic.
- **6.** These recommendations will have a significant impact on the operating and maintenance related costs of the HVAC systems.
